Lamprobe Post Care Instructions

- ✓ Do not directly touch treated area for 24-48 hours following treatment, as this can increase the risk of infection.
- ✓ Do not pick at the scabs, as premature removal of scabs may result in hyper-pigmentation, infection, or scarring.
- ✓ If the cosmetically treated area is still irritated in the evening, then apply antibiotic cream, e.g., Neosporin, or medicated powder to the area. Keep the area dry for 24-48 hours following treatment.
- ✓ While cleansing the face or showering, use mild products without alcohol. When appropriate, band aids should be applied to the treated area for further protection while showering or bathing.
- ✓ After washing, pat the treated area dry. Do not rub the treat area as rubbing may result in the removal of the scab.
- ✓ Do not apply make-up on the cosmetically treated area for 24 hours following treatment or until skin is healed.
- ✓ Do not use any other form of peeling or bleaching products for at least 21 days following treatment.
- ✓ Use of sun protection during the day, all year round, is recommended. Avoid direct sunlight during the peak hours (11am-5pm).

Please contact the office if you have any questions or concerns.
